                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                         (http://www.jax.org/resources/documents/dhares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gelectrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114)pblAR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

BI895704 425 bp mRNA linear EST 15-OCT-2001 EtESTed23h03.yl Eimeria tenella S5-2 cDNA Neg Selected Elmeria tenella cDNA 5', mRNA sequence.

DEFINITION

BI895704

ACCESSION VERSION KEYWORDS SOURCE

BI895704.1 GI:16138840

Eimeria tenella. Eimeria tenella

ORGANISM

Eimeria.

REFERENCE AUTHORS

Eukaryota; Alveolata; Apicomplexa; Coccidia; Eimeriida; Eimeriidae;

CNSO3FOQ 968 bp DNA linear GSS 17-MAY-2000 Tetraodon nigroviridis genome survey sequence T7 end of clone 021M15 of library G from Tetraodon nigroviridis, genomic survey
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Direct Submission
Submitted (12-APR-2000) to the EMBL/GenBank/DDBJ databases
This sequence is a single read and was generated as part of a large
scale clone-end sequencing project of the Tetraodon nigroviridis
genome. For more information, please take a look at

/note="Vector: Bluescript SK-; Site_1: EcoRI; Site_2: XhoI
; Sporozoites were obtained from in vitro sporulated and
excysted oocysts of E.tenella grown in chickens. CDNA was
synthesized from poly mRNA using an oligo-dT primer
containing a XhoI site. Following second strand synthesis,
EcoRI adapters were ligated to the CDNA and products were
slace-selected on sephacryl S500. The CDNA were ligated to
ECORI/XhoI prepared lambda Zapii (Stratagene). Clones were
converted to phagemids by mass excision using ExAssist
helper phage and E.coli Solx cell (Stratagene). Clones
were selected by negative hybridization against a pool of
overrepresented ESTS (N>-10, from 1682 previous reads).
Insert sizes range from 1.2-2.9Kb. The library may contain
a small percentage of host or bacterial contaminents.

Comparative EST analyses provide insights into gene expression in
two asexual developmental stages of Eimeria tenella
Unpublished (2001)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /note="Vector: Lambda 2APII; Site_1: EcoRI; Site_2: XhoI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sporozoites were excysted in vitro from E. tenella Hoocyste, purified by column chromatography and mRNA extracted using a FASTRACK kit (Invitrogen). CDNA was synthesised and a Uni-ZAP XR library was constructed. using cDNA synthesis kit, ZAP-CDNA synthesis kit and ZAP-CDNA Glapack III Gold cloning kit (Stratagene). The library was amplified once through E. coli XIJ-Blue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Length 325;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score 40.6; DB 10;

The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ΙĮ

of pWD42 (gi[4732114|gb|AFI29072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for amplialin resistance.

Total RNA was prepared, poly(A) RNA was purified, one CDNA library was made, and 1 million pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids in the TY close lab at the University of California, Riverside (Akhunov, Chin, Choi, Close, Fenton, Kianian, Otto, Simons, Zhang). Phagemids were plated and

```
0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oilgonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size selected for a 9.5 to 10.5 K range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of PWD42 (gil4732114|gb|AF129072.1); a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance.

understanding the harpin (Erunnia amylovora hypersensitive response elicitor) induced signal transduction pathway in plants. The protein is useful for studying the downstream components of signal transduction pathway in plants which eventually leads to disease resistance, growth enhancement, insect control and stress resistance. Imparting disease resistance to plants through HRE treatment has the potential to treat previously untreatable diseases, treating diseases systemically which might not be treated separately due to cost and avoids the use of infectious agents or environmentally harmful materials. By HRE treatment infectious agents or environmentally harmful materials. By HRE treatment increased quantity of seeds produced, increased percentage of seeds geninated, increased percentage of seeds geninated, increased percentage of seeds geninated, increased percentage of seeds ferminated.
                                                                                                                                                                               receptor in plants for plant pathogen hypersensitive response elicitors (HRE). The plants are made resistant to infection by viruses, bacteria and fungi and are imparted with resistance against environmental stress and insects through HRE treatment. The protein is useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ruits, etc. which results in economic benefit to cultivators. polypeptide or protein in a non-infectious form to a plant or plant seed under conditions effective to enhance growth of the plant or plant seed under conditions effective to enhance growth of the plant or plant seed transformed with a DNA molecule encoding a HRE plant seed transformed with a DNA molecule encoding a HRE polypeptide or protein, and growing the transgenic plant or produced from the transgenic seed under conditions effective to produced from the transgenic seed under conditions effective to produce plant growth. HRES (see AAW62454 59) or nucleic acids encoding them (see AAV39972-75) can be used to increase plant growth. The HRES may also result in increased plant height and yield, and effect early germination and maturation of plant seed and early colouration of fruit and plants.

The invention relates to methods of imparting hypersensitive response induced resistance to plants by treatment of seeds. Isolated HRE proteins can be applied to seeds as a

                                   This is the amino acid sequence of a hypersensitive response elicitor (HRE) of Pseudomonas solanacearum. The invention relates to the use of a HRE polypeptide or protein to control insects on plants or plants grown from seed treated with HRE. Also claimed is a method of insect control for plants that involves: (a) providing a transgenic plant or seed transformed with a DNA molecule (see AAV34606-09) encoding a HRE polypeptide or protein (see plants produced from the transgenic plants or transgenic plants produced from the transgenic seeds to control insects. HRE prevents direct insect damage to plants by feeding njury. It kills insect close to plants, and interferes with insect larval feeding on such plants. It also prevents insects from colonising host plants and releasing phytotoxins which result in disease damage to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents a hypersensitive response elicitor protein (also called hairpin protein) that is able to elicit a hypersensitive response in plants. The specification also describes
means of imparting pathogen resistance to plants grown from the seeds. Alternatively, bacteria containing the gene encoding the HRE can be applied to the plant seeds, or transgenic plant seeds containing a DNA molecule encoding an HRE polypeptide or protein are used. HRE polypeptide sequences from Ervinia chrysanthemi, Erwinia amylovora, Pseudomonas syringae, Pseudomonas solanacearum, Xanthomonas campestris pv. glycines and Xanthomonas campestris palargonii (see AAW61113:18) are provided. The methods can impart pathogen resistance without using agents which are harmful to the environment or pathogenic to the plant seed being treated, or to
                                                                                                                                                                                                                                                                                                       44;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New fragments of an Erwinia hypersensitive response elicitor prand related DNA – used to impart disease resistance to plants, increase their growth and to control insects

The present sequence is a hypersensitive response elicitor protein from Pseudomonas solanacearum. The protein is used to impart stress resistance to plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Application of a hypersensitive response elicitor protein to plants to

            The protein, in non-infectious form, is applied to plants to impart disease resistance (to a wide range of viral, bacterial and fungal pathogens), to improve growth (yield, quantity and quality of seeds, to provide earlier germination etc.) and to control insects (e.g. coborers, Lepidoptera larvae etc.) The same results are provided by transgenic plants expressing the protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Hypersensitive response elicitor; environmental stress resistance; plant.

The chimeric gene is used in gene therapy. The chimeric gene is useful as an effective and safe means of controlling plant-pathogenic fungi, particularly comycetes, which are responsible for major crop loss and is also useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       for producing transgenic plants of the invention. The present sequence is Pseudomonas solanacearum hypersensitive response elicitor protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The hrpw gene was isolated from E.amylovora using a 48-fold degenerate oligonucleotide probe corresponding to amino acids 9-15 at the N-terminus of harpin. The 4KD protein encoded by the hrpw gene is a hypersensitive response elicitor protein. The harpin is thought to be an archetype for HR elicitors from phytopathogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Rosaceae; apple; pear; phytopathogenic bacteria; defence reaction; hypersensitive reaction and pathogenicity; hrpN; gene cluster; ds.

Erwinia amylovora hypersensitive response elicitor (HRE).

09-NOV-1998 (first entry)

. AAW62455;

AAW62455 standard; Protein; 403 AA.

AAW62455

```
This is the amino acid sequence of a 39 kDa, heat stable hypersensitive response elicitor (HRE) of Erwinia amylovora. The invention relates to the use of a HRE polypeptide or protein to control insects on plants or plants grown from seed treated with HRE.

Also claimed is a method of insect control for plants that involves:

(a) providing a transgenic plant or seed transformed with a DNA complecule (see AAV54606-09) encoding a HRE polypeptide or protein (see AAW75862-67); and (b) growing the transgenic plants or transgenic plants produced from the transgenic seeds to control insects. HRE prevents direct insect damage to plants by feeding injury. It kills insects close to plants, and interferes with insect larval feeding on such plants. It also prevents insects from colonising host colons.

enhance plant growth. HREs (see AAW62454.59) or nucleic acids encoding them (see AAV39972-75) can be used to increase plant growth. The HREs may also result in increased plant height and yield, and effect early germination and maturation of plant seed and early colouration of fruit and plants. E. amylovora HRE can be applied to tomato plants to enhance growth without causing disease in that species; this bacterium is a pathogen of apple and pear but not
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GSDANQ--ECGNEQPQNGQQ----EGLSPLTQMLMQIVMQLMQNQGGAGMGGGGSVNSSL 110
                                                                                                                                                                                                                                                                                                                                                                                                            response elicitor polypeptide or protein which may also effect, e.g. increase in plant height or earlier germination seed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This is the deduced amino acid sequence of the 39 kDa, heat stable hypersensitive response elicitor (HRE) of Erwinia amylovora. A method of enhancing growth in plants comprises: (a) applying a HRE polypeptide or protein in a non-infectious form to a plant or plants grown from the seed, or (b) providing a transgenic plant or plants grown from the seed, or (b) providing a transgenic plant or polypeptide or protein, and growing the transgenic plant or polypeptide or protein, and growing the transgenic plant or provided from the transgenic seed under conditions effective to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GNNFSNIGNL---QTMGI-GPQQHEDSSQQSPS-AGSEQQLDQLLAMFIMMMLQQS---Q 56

It is heat stable at 100 degc for at least 10 min, has a pl of approximately 4.3, and contains substantially no cysteine. The invention relates to methods of imparting the proteins resistance to plants by treatment of seeds. Isolated HRB proteins can be applied to seeds as a means of imparting pathogen resistance to plants grown from the seeds. Alternatively, bacteria containing the gene encoding the HRB can be applied to the plant seeds, or transgenic plant seeds containing a DNA molecule encoding an HRB polypeptide or protein are used. HRB polypeptide sequences from Ervinia chrysanthemi, Ervinia amylovora, Pseudomonas syringae, Pseudomonas solanacearum, Xanthomonas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      campestris pv. glycines and Xanthomonas campestris pelargonii (see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           environment or pathogenic to the plant seed being treated, or to adjacent plants. E. amylovora causes disease in apple or pear but not tomato. However, it elicits a hypersensitive response in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Thus, E. amylovora can be applied to tomato seeds to pathogen resistance without causing diseases in plants of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        pathogen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             protein of

```
The present sequence represents a hypersensitive response elicitor protein (also called hairpin protein) that is able to elicit a hypersensitive response in plants. The specification also describes hypersensitive response elicitors from other pathogenic organisms. The protein, in non-infectious form, is applied to plants to impart disease resistance (to a wide range of viral, bacterial and fungal pathogens), to improve growth (yield, quantity and quality of seeds, to provide earlier germination etc.) and to control insects (e.g. corn transgenic plants expressing the protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New fragments of an Erwinia hypersensitive response elicitor protein and related DNA - used to impart disease resistance to plants, to increase their growth and to control insects
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          5 GNNFSNIGNL---QTMGI-GPQQHEDSSQQSPS-AGSEQQLDQLLAMFIMMMLQQS---Q 56

Submitted (SEP-1999) to the EMBL/GenBank/DDBJ databases.
--- FUNCTION: Act as a specific hypersensitive response (HR) elicitor.
Has activity on tobacco (non-host plant) and petunia but is
without activity on tomato (host plant).
--- SUBCELLUIAR LOCATION: Secreted.
--- FUN: POPA2 and popA3 are produced from popA1 by stepwise removal of N-terminal amino acids.

Cell. Biol. 11:2994-3000(1991).
-!- FUNCTION: PROBABLY INVOLVED IN THE RNA METABOLISM OF NEURONS.
-!- SIMILARITY: CONTAINS 3 RNA RECOGNITION MOTIFS (RRM).
-!- SIMILARITY: BELONGS TO THE ELAV FAMILY OF RNP PROTEINS.

FUNCTION: BINDS BOTH SINGLE-STRANDED AND DOUBLE-STRANDED DNA AND PROMOTES ATP-INDEPENDENT ANNEALING OF COMPLEMENTARY SINGLE-STRANDED DNAS. AND D-LOOP FORMATION IN SUPERHELICAL DOUBLE-STRANDED DNA. MAY PLAY A ROLE IN MAINTENANCE OF GENOMIC INTEGRITY (BY SIMILARITY).
                                                                                                                                                                                                         THROUGHOUT (EXCLUDING NUCLECAL), TOGETHER WITH A SMALL NUMBER OF INTENSELY STAINED FOCAL POINTS, OR GRANULES, AND PUNCTATE STAINING ALONG THE NUCLEAR ENVELORE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PROSITE; PS5010; RRM; I.
